ABSTRACT

The "paperless" ship is an idea which has been advocated at the highest levels in the Navy. The goal is to eliminate the enormous amount of paper required in the normal operation of a modern naval warship. The ARGOS system under development at the Naval Postgraduate school is a prototype solution which uses HyperCard/HyperTalk for prototype development. The operations functional area, including sections for training, scheduling, message generation, and publication management is an important part of this development.

I. INTRODUCTION

The Navy of today capitalizes on virtually all aspects of modern technology. Nuclear power, cruise missiles, and satellite communications are but a few of the many examples of quantum leaps in technology which have been taken full advantage of by the U. S. Navy. The ability of shipbuilders and designers to quickly understand the benefits of a new technology, and implement that technology in U.S. Warships has been a hallmark of the U.S. Navy for over a century.

In the latter half of the twentieth century, the dominant new technology has been the computer. Computer technology has been implemented in fire control, guidance, and navigation systems, greatly enhancing capabilities in those areas. As far as non-tactical uses of computers are concerned, the primary implementation has been the shipboard non-tactical ADP Program (SNAP). The goals of the SNAP program are: "To collect information only once; to provide maximum automated information systems(either on line or off line); to require minimal supply, maintenance and training support; and to require no additional shipboard personnel."¹

SNAP does not fully capitalize on existing technology in handling non-tactical data and information onboard a ship. Today, it is estimated that a small combatant (DD, FF) carries onboard upwards of twenty tons of paper [Ref. 1: p. 157]. Much of this weight is in the form of technical, training and maintenance manuals, personnel administration, and training records, and various other instructions and publications. Keeping this myriad of publications updated and accessible, and simply storing such a volume of

¹ As stated in the SNAP II Organizational Maintenance Management Subsystem desk top guide.

paper quickly becomes a problem on a warship that has been optimized for space. On any modern combatant, space used to house paper is at a compromise of the mobility, habitability and warfighting capability of the ship. It is for these reasons that the "paperless ship" concept was introduced.

The goal of the paperless ship is to remove as much paper, if not all paper from a ships in order to reclaim the space and weight taken up by the paper for more mission critical uses. The ARGOS project is an effort to satisfy the requirements of the paperless ship, while maintaining the stated goals of the SNAP program.

The ARGOS project allows for computerized access, manipulation and creation of data normally stored on paper, ARGOS additionally allows commanding officers and battle group commanders to instantly access the material, personnel and training readiness of their ship or battle group, by accessing the information available through ARGOS.

ARGOS is a multi-media, object oriented, event driven data base system which combines textual and graphical data in allowing any use of that data that would be available if the data were stored on paper. The ARGOS prototype has been implemented at the Naval Postgraduate School using a Macintosh 2 computer, the HyperCard programming environment, and the HyperTalk programming language. At present, ARGOS is divided into six different modules, or functional areas; maintenance, operations, supply, administration, medical and personnel. This division is not static, but is merely a method of dividing the ship's administrative workload for the purpose of prototype development.

The purpose of this thesis is to demonstrate a design and implementation of an operations module for the ARGOS system, and to integrate it with the other modules in the ARGOS system.

2 Macintosh, HyperCard, and HyperTalk are registered trademarks of Apple Computer Inc.

The thesis is organized as follows:

- The statement of the problem. Identifying data and operations unique to the module.
- Programming environment. A brief discussion of HyperCard and HyperTalk.
- Implementation. A description of how the module was created.
- Conclusions. Lessons learned from the research, as well as recommended areas for further study/review.

The script listings for prototype stacks developed in conjunction with this thesis are included as Appendices A through F.

II. PROBLEM STATEMENT

The operations officer on a FFG-7 class ship in the U.S. Navy has been provided with state-of-the-art detection, surveillance, communications, and weapons systems for his use as a watchstander. When he is through with his watch, however, he conducts his business for the most part without the help from modern technology. The responsibilities of the operations officer usually include the following:

- Preparing the ship's employment schedule.
- Maintaining tactical publications and instructions, operations order, and Naval warfare publications.
- Serving as the ship's Training Officer.
- Communications.

In preparing the ship's schedule (sometimes one year or more in advance), a method is needed to make the initial schedule, revise it, and present alternative schedules for final approval. When done manually, this process involves many hours of additions, deletions, and rewrites, and becomes very labor intensive. The schedule approved is only a proposal, and must be forwarded to the fleet and type commanders for approval. The official ship's schedule which results is invariably different, which requires generation of the new schedule sheets.

The maintenance of the tactical publications and instructions library appears to be straight forward. This includes entering promulgated changes, and keeping custody records for each publication. When a publication is needed, its location and change status (that is, what changes have been entered) must be determined. This is usually accomplished by locating the publication librarian or searching the ship's office in the hope of finding what

is needed. Depending on the availability of personnel, this can be time consuming, and frustrating exercise.

The duties of the ship's training officer include:

- Scheduling standard training requirement (STR) accomplishment.
- Overall responsibility for divisional and departmental training, and General Military Training (GMT).
- Surface Warfare Officer (SWO) and Enlisted Surface Warfare Specialist (ESWS) training.
- Management of off-ship schools.

STR scheduling and record involves ship's exercises as specified in Fleet Exercise Publications (FXP). The ship generates and submits to the type commander a training report periodically. This computer formatted message is entered into the type commander's database and the ship receives a report of its training status for the type commander. The problems that arise are ensuring that all exercises conducted since the last training report are included in the message, and properly updating the database (manually).

The oversight of divisional and departmental training consists mainly of ensuring compliance with Navy training requirements and regulations. These requirements include maintaining training records (schedules, attendance records, accomplishment records), lesson plans, and qualified instructors lists. On even a small ships, this involves a massive amount of paper. Additionally, the formats for attendance records and lesson plans vary widely from division to division. SWO and ESWS training require the same records that divisional training does, but these records are maintained by the Training Officer personally.

Managing the ships utilization of off ships schools involves knowing the ships requirements for graduates on board, and scheduling school quotas to maintain the proper number of graduates onboard. The required graduates information is promulgated by the type commander as part of a TYCOM instruction. The scheduling information for convening

dates and available quotas is located in the Catalog of Navy Training Courses (CANTRAC). Searching for a particular course in the CANTRAC, which is distributed on microfiche, can be very tedious and time consuming.

The final area of responsibility is communications. Messages transmitted by a ship are either free format text messages (similar to a telegram), or formatted messages to be entered into the World Wide Military Command and Control System (WWMCCS) database. Formatted messages follow a strict format which enables the data contained to be scanned into the WMMCS database by computer. It follows that the best way to draft such messages is via computer. A software system is presently in the fleet to do this, but it is a stand alone system used only in generating formatted messages.

With the exception of formatted message generation and maintenance of individual training via service record entries, the functions described above are done manually, often at the expense of efficiency. The operations module for ARGOS should address these areas and make the performance of these tasks much more effective and efficient.

The major problem in developing such a system at the Naval Postgraduate School is ensuring that the information used in development is current and correct. We are "out of the loop" in the promulgation of new directives, and changes in existing instructions. While we may draw on personal fleet experience as a guide, ensuring 100% correctness of the information used to develop the system is impossible at NPS.

Another consideration is the security classification of the information. A complete system could not be implemented without addressing this issue, especially in the area of message generation. Since the goal is a working prototype that will demonstrate the capabilities of the system, these problems have minimal impact on system development. They must be addressed however, before a complete system can be implemented.

III. THE PROGRAMMING ENVIRONMENT

This chapter discusses the HyperCard environment and its programming language, HyperTalk. HyperCard was developed by Apple Computer for use in the Macintosh family of computers. HyperCard version 1.2.1 was used in developing this thesis.

HyperCard is an event-driven, object oriented programming environment. All HyperCard actions are initiated by messages sent to objects [Ref. 2: p.12]. The basic structure of HyperCard is the stack. The term "stack" should not be confused with the standard last-in first-out data structure normally associated with the word stack in most computer applications. In HyperCard, a stack is analogous to a 3x5 card file. Each stack is a HyperCard object containing one or more HyperCard cards. Each card consists of pictures (graphics), fields, and buttons. Fields, and buttons are also HyperCard objects, while pictures are not. Fields are areas where text is read or entered by the user, and where text is stored for access and manipulation by HyperCard. A field may be locked to prevent modification by the user, or unlocked to allow text to be added or deleted. Buttons are primarily designed to perform some action on mouse events (e.g., mouseUp, mouseDown). The final HyperCard object is the background. A background has the same structure as a card, it may contain graphics, fields, and buttons and is associated with a particular stack. A background is shared by cards in a stack, each card is associated with a background. If a stack contains only one background, it is said to be homogeneous. If there is more than one background in a stack, the stack is heterogeneous.

Each card, in effect, consists of several layers. At the bottom is the background graphics layer. Any graphics common to several cards are placed here. Background buttons and fields come next, each occupying its own layer. The background is visible in all

cards associated with that particular background. At the card level, the same structure as in the background is followed. The graphics is the lowest layer (furthest from view), with buttons and fields layered above.

Events in HyperCard cause it to send messages, which in turn may cause some action to occur based on the contents of the script of the object receiving the message. Messages travel through HyperCard along a message hierarchy, which is a one way path from buttons and fields, to the card, the background, the stack, the home stack, and finally to HyperCard itself. The location in the hierarchy at which HyperCard sends a message is called the entry point [Ref. 3: p. 376]. When a message is sent HyperCard searches the script of the object at the entry point for a message handler for the current message. If a message handler is found, it is executed and the message is “trapped” (i.e., it stops its journey up the message hierarchy). If no message handler is found, the message continues up the hierarchy to the next level. If the message gets to the HyperCard level without encountering a message handler, it is lost and no action results. When a handler executes, it sends its statements as messages, first to its own object, and then up the message hierarchy. A message handler acts on the object in which it is contained, regardless of where the message originated.

Statements in a HyperTalk script may be HyperTalk commands, HyperTalk functions, user-defined functions, external commands (XCMDs), or external functions (XFNCs). XCMDs and XFNCs are written in Pascal, C, or 68000 assembly language and compiled separately. They are then added as resources to the stack and may be called by HyperCard. XCMDs and XFNCs allow the programmer to add features to a HyperCard stack that are not supported by HyperCard itself. HyperTalk offers a fairly complete set of commands and functions, and the ability of the programmer to define his own functions, extends the applications of HyperCard.

There are several advantages in using the HyperCard environment and HyperTalk for the development of the ARGOS operations module. The interface is very intuitive, which allows the user to quickly learn how to use it. Stacks can be created using HyperCard alone without any knowledge or use of HyperTalk code. Users can rapidly discover the power of HyperCard before even familiarizing themselves with the HyperTalk language.

HyperTalk is very close to the natural language. Commands closely resemble imperative English (e.g., "put card field 1 into field answer"), and the syntax is relatively forgiving. This allows the new programmer to quickly become comfortable in writing HyperTalk scripts, which, in turn allows for faster prototype development.

HyperTalk is an imperative language, which eliminates the need for compilation and "make" commands associated with most high level languages. This greatly speeds up stack development and debugging. HyperTalk's imperative nature can have a negative impact on execution speed, but execution is still fast enough in most instances. Since HyperTalk is object-oriented, scripts tend to be small, easy to understand and fully transportable to other objects scripts. The benefits of using HyperCard/HyperTalk as a prototyping tool can be summarized in the fact that the time (cost) of development is drastically reduced.

IV. IMPLEMENTATION

A. REPORTS

The reports subarea is designed to aid in the composition of formatted messages for transmission from the ship to higher authority. These messages follow a strict format to allow the information contained in the message to be added to the WWMCCS data base. The prototype message generator modeled the Oprep-3 message reporting system. Oprep-3 messages are transmitted to report incidents of high national or Navy interest. Guidelines for submission of Oprep-3 reports are contained in OPNAVINST 3100.6D, which was used in the development of this system. Due to their nature, Oprep-3 reports are very time sensitive, with submission of the initial report required within 20 minutes of the incident. Additionally, since the reports are formatted, the format must be strictly followed. With these requirements in mind, the system was designed to enable the user to quickly draft an Oprep-3 message, while at the same time ensuring that format and content requirements of OPNAVINST 3100.6D are adhered to.

When the user selects "Reports" from the operations menu, he then is sent to the reports stack. The first card in the stack contains a button labeled "Reports". This button uses the HPopUpMenu XCMD³ to implement a heirarchical pop up menu of report types. The menu appears when the mouse is down and dragged down towards the bottom of the screen from within the button. When the mouse crosses the bottom edge of the button, the first menu appears. This menu lists the different report types that may be drafted. The menu was taken directly from the formatted message origination system (FMOS), which is a stand-alone system currently available in the fleet. The only menu choice implemented

³ The HPopUp.Menu was written by Guy de Picciotto and is available as "freeware" through International Datawares Inc., San Jose, CA

is "Oprep-3". When the mouse is dragged into this choice, another menu pops up listing the different types of Oprep-3 messages. "Navy Blue" is the only choice implemented, and is selected by releasing the mouse over the selection.

When "Navy Blue" is selected, the user is sent to the Navy Blue Card. This card lists all the required and conditional data elements used in drafting an Oprep-3 Navy Blue message. An open card message handler is used to ask the user through the use of dialog boxes whether the report is an initial report, an amplification of an earlier report, or the final report on the incident being reported. The response is recorded in a global variable for later use. The user is also asked to choose the Classification for the message (secret, confidential, or unclassified) and this response is also stored in a global variable. The classification can be subsequently changed by choosing the "Classification" button on the Navy Blue card.

Once the open card handler has executed, the user can then either draft the message by choosing the appropriate data set, or enter the addressees for the message. The data sets are listed on the Navy Blue card, and are selected by clicking the mouse on the data set name. When the data set is chosen, the user is then sent to the "Set Library" stack, and the card containing information on the data set chosen. Each data set card has a field defined for each message data set. Individual data elements can be either required or optional. Data element fields can be of a fixed length, variable (with a maximum length), or free text (unlimited length). The system must ensure that entered data elements are within the format size limits, and that they do not contain illegal characters. This was accomplished by the use of the HyperCard idle message.

The idle message is sent by HyperCard to the current card when no other system operation is taking place. Each data set card keeps track of the cursor location by putting the field name of the active field into a hidden card field. The card sends the idle message to that field, and each field has an on idle message handler. The on idle handler in the field

checks for illegal characters - namely the slash (/), which is used in the Oprep-3 reporting system as a data field delimiter. This checking is done quickly through the use of the offset function. The offset function returns the location of an indicated chunk of text in a specified container. If the chunk is not in the container, zero is returned. If the offset of the single slash in the present field is not zero, then the slash is removed, a beep sounds, and the cursor is placed after the location of the deleted slash.

The length of the active field is also checked in the field's idle handler, if necessary, through the use of the "length of" function. If the user enters an extra character in the field, the extra character is deleted, a beep sounds, and the cursor is placed at the end of the field. The user can progress through the fields by using the mouse, the tab key, or the return key. Each field has a mouse within handler to select after the last character of that field when the mouse is within the field.

Where possible, required data known by the message generating system is automatically entered into the appropriate data field. The originator of the message (USS Jarrett in the prototype), the message type, the report type (initial, amplification, or final) and the report serial number are all entered in the appropriate fields by the system. The serial number of the message is automatically incremented when the user enters the message card (Navy Blue in the prototype) if the message is cancelled, the proper serial number is restored. This automatic data entry feature decreases the time required to draft the message.

Each data set card contains an "Enter", "Return", and "Delete" button. The enter button verifies that all required data fields are present. If required data is missing, an error message is displayed, and the user is returned to the appropriate data field. If all required data is present, the data fields, the single slash delimiters, and the double slash end of data set marker are entered into the message, adhering to the 69 character per line requirement of OPNAVINST 3100.6D, and the user is returned to the Navy Blue card. The delete button deletes the data set from the message currently being drafted, and returns the user

to the data set card. The user is then returned to the message card to choose the next operation. The cancel button simply empties all data fields on the data set card, and returns the user to the message card.

All information on data set content contained in OPNAVINST 3100.6D appears in the graphics of the appropriate card. The field delimiters and end of set marker are also on the card in the appropriate places. The data entry fields use the courier 12 font, which is proportional. If the field can contain a maximum of 20 characters, then any 20 characters of courier 12 will occupy the same amount of space. This was important in tailoring the physical size of the data fields, allowing only the proper number of characters to be displayed.

The addressees of the message are entered by clicking the "addressees" button on the message card. The user is then sent to the addressee card. This card automatically contains the action and information addressees required by OPNAVINST 3100.6D for the message. Additional addressees may be required, depending on the incident being reported. These addresses may be entered by clicking on the appropriate address. When all addresses have been entered, they may be entered by clicking the enter button, or canceled by clicking the cancel button. In either case, the user is returned to the message card.

When the message drafting is complete, the user may review the message to ensure that the information is correct, and to check spelling etc. Manual changes can be made to the message at this stage. The message can then be printed, or canceled. If it is printed, it is also saved for future reference on its own card. Printing of the field is done by using the PrintField XCMD.⁴ The saved messages can be viewed and deleted through the message file. The message file is accessed via the "Msg File" button located on the top card of the reports stack.

⁴ Portions of the PrintField XCMD are copyrighted by Think Technologies. It was written by Mark Scherfling.

B. TRAINING

1. Ship Training

Ship training is conducted according to standard training requirements (STRs), which describe training evolutions conducted by the ship in various mission areas (ASW, AAW, etc.). Mission area STRs are divided into five categories, core, basic, intermediate, advanced, and repetitive. Each mission area has an "M-rating" which describes the status of training readiness in that mission area. M-ratings are from M-1 to M-4, and are determined by the status of the mission area STRs. When an STR is conducted, a rating of M-1 is assigned. For repetitive STRs, the M-rating degrades to M-2, M-3, and finally M-4 at intervals defined in fleet exercise publications. For all other STR categories the M-1 rating is current for 21 months, at which time it degrades directly to M-4. Due to classification considerations, the Mobility (MOB) mission area was the only mission area modeled by the prototype. The MOB mission area is further divided into four sub-areas: Engineering (MOB-E), Damage Control (MOB-D), Seamanship (MOB-S), and Navigation (MOB-N).

Each STR is uniquely identified by a unique six digit exercise code. The first two digits identify the primary mission area, the third digit identifies the training category, and the fifth and sixth digits identify the STR within the particular category. Data for each STR are stored using the "item" facility of HyperCard. An item is a chunk description for a string in a container delimited by a comma. For example, if "Tom,Dick,Harry" were in a container, "Tom" would be item 1, "Dick" item 2, and "Harry" item 3. The item facility makes access to data elements a quick, easy and accurate process, especially when certain data elements may be of varying length or omitted entirely. For STR data storage, the data items are, in order, exercise code, STR number, Exercise Name, M-rating, completion date, expiration date, score, evaluation method, and reporting source. Additionally, repetitive STRs have the added items of M-2 degradation period, M-3 degradation, and

M-4 degradation. These item lists are stored in background fields, with a dedicated card for each primary mission sub-area (MOB-E, MOB-D, MOB-S, MOB-N). Background fields must be used, as the HyperCard find command will not search card fields. For each of these fields containing the STR item lists is a corresponding background field which contains the same information formatted for viewing by the user. This apparent redundancy is necessary since data stored as items are in an inappropriate format for viewing by the user.

To view the STR data base, the user selects the STR option in the training pop up menu on the first card of the stack. When this item is selected, the second pop up menu offers the option of viewing the data base or drafting a training report (TRAREP). When the "View" option is chosen the user is sent to the view card, which has an open card handler which asks the user to input the mission area to view. Any of the subareas, or the entire MOB data base may be viewed. The user can update the database by clicking the "Update" button. The updating process involves checking the expiration date of each STR in the database currently in view. If the grade has expired, the M-rating is degraded, and the expiration date is erased. The date of the most recent update is displayed on the screen, and is stored in a field on the appropriate data storage card. the M-rating for the mission area in view can be determined by clicking the "M-Rating" button. The new M-rating is calculated, displayed, and stored in the same manner as the update information.

The M-rating operation does not update the expiration dates, and the M-rating computed is only as good as the data in storage.

When an STR is accomplished, the fact is recorded by clicking the "Enter Data" button. This button asks the user to enter the exercise code, completion date, score, and evaluation method. The data is entered in the appropriate data item line, a new expiration date is computed, a M-rating of M-1 is assigned, and the string "PDG" is placed in reporting source field. This marks the data as unreported, ensuring that it will be included

in the next TRAREP. The corresponding data viewing field is also updated, and the result is sent to the viewing field on the card the user is currently viewing.

When the user desires to draft a TRAREP, this option is selected from the pop up menu on the training card. The user is then sent to the “draft TRAREP” card, which has three buttons; “Draft”, “Cancel”, and “Print”. The card has an open card handler which automatically increments the message serial number and displays it on the screen, and records and displays the date-time-group of the message. When the “Draft” button is clicked, the entire STR database is searched for the “PDG” flag in the reporting source item. When a PDG flag is found, the appropriate data is entered in the TRAREP, and the new serial number is placed in the reporting source item. If no STR accomplishments are found, the user is notified, and the message drafting process is aborted. The user is then asked if there is any air controller data to report through a series of HyperCard “Ask” and “Answer” functions. When the message is completed, it is displayed for review, and may be either saved/printed by clicking “Print”, or canceled by clicking “Cancel”. If cancel is selected, the database is returned to its previous state (the “PDG” string replaces the new serial number), and the user is returned to the training card. The Print operation is performed by using the PrintField XCMD, since HyperCard does not directly support the printing of fields only.

2. Personnel Training

Personnel training is conducted in accordance with the Personnel Qualification System (PQS), leading to qualification in various PQS watch stations. The prototype provides a mechanism for scheduling PQS training on a quarterly basis. The options available to the user are:

- Schedule creation
- Schedule modification
- Recording training accomplishment

- Schedule deletion
- Drawing and printing a training schedule chart.

Each option is accessed using the pop up menu described previously, and each has its own card.

The schedule creation card has the open card handler which asks for the title of the schedule and the calendar quarter of the schedule. When the quarter is entered, a calendar for the three months of the quarter is drawn on the card for the user to refer to. The user then enters the lesson name and scheduled date of training for up to 15 lessons. Data is stored using the item feature, with item 1 being the lesson name, item 2 the date, and item 3 either an "S" or a "C" to indicate scheduled or completed training. When the schedule is saved, a new card is created, and the title, quarter, and schedule data are stored in card fields. The name of the card is the title of the schedule and the quarter scheduled. this allows for the use of the same schedule title in many different quarters. A listing of schedule card names is maintained on the "Schedule File" card. When a lesson is completed, it is annotated in the "Record Accomplishment" card. The user enters the date the lesson was conducted, and the schedule date is replaced by this date, and a "C" is placed in item 3 for the specific lesson to signify completion. The schedule is then returned to storage with the changes added.

The user can draw a schedule any time after it has been created by selecting the "Draw Schedule" option from the pop up menu. The 15 lesson limit on schedules is due to the space limitation of the draw function. The drawing process uses the line and text painting tools available in HyperCard. Two problems were encountered in implementing this function. First, when changing fonts while printing text, all text entered since the last mouse click is changed to the new font. Therefore, before changing fonts, the mouse must be clicked to ensure all text remains in the desired font. Second, when entering text near

other graphics with white space surrounding the text character. To avoid this, text is entered first, and graphics afterward. When the schedule chart is completed, it may be printed using the HyperCard print card function.

A major problem with the HyperCard date functions was also encountered in implementing this area. All dates entered must be in the HyperCard "Short date" format (e.g., 6/7/89 for 7 June 1989). The problem is the fact that HyperCard will accept an invalid date (e.g., 2/31/89, 13/13/89) and transform it into some date which is valid format, but incorrect in content. This problem was overcome by creating a user defined function validDate which ensures that only valid dates are entered into the training data base in both the ship training and personnel training areas.

C. PUBLICATIONS

The publications subarea was created in the prototype to serve mainly as a stub for future development. The facilities provided are:

- Finding a publication by title.
- Listing publications by originator.
- Listing publications by classification.
- Listing publications by location/custodian.
- Entering/Deleting titles.
- Updating custodian or change number information.

Data is stored in a background field using the item facility, with a corresponding field of formatted data for the user to view. The data items are: Title, annex number, appendix number, tab number, effective date of the publication, classification, latest change number and custodian. The change number and custodian information can be changed by the user, new titles can be entered, and titles can be deleted. Data storage is similar to the STR data base. All data items are stored in a background field, with corresponding formatted data for viewing stored in another background field on the same card. When changes are made

to the database, both fields are updated accordingly. The prototype is only an inventory system, since mass storage for the large volume needed to store an entire publication library, and security issues are still under research.

D. SCHEDULES

The schedule subarea is designed to facilitate the creation of the ship's employment schedule, and also to record the ship's actual employment for historical purposes. Information on employment scheduling was taken from Naval Warfare Publication 10-1-10 Chapter 8. the methods used were very similar to the personnel training scheduling functions described in section B. Schedules are created, modified, deleted, and drawn in much the same manner. There are some significant differences, however.

A schedule event must have a start date and an end date, they are the same for a one day event. Also, events are defined as either occurring in port or underway, and any event may be either a major (primary) or concurrent employment. The ship must have one major employment schedule for every day of the quarter. Again, the item facility was used, with data items as follows: employment abbreviation, start date, end date, major or concurrent employment, and inport or underway.

Employment abbreviations are stored in a background field, and a corresponding field of formatted data for viewing. These fields do not change, with all data being a reproduction of table 8-1 of NWP 10-1-10. When a schedule abbreviation is entered during creation or modification, a check is made using the find function to ensure its validity. If it is not a valid entry, the user is notified. On a valid entry, the inport/underway status of the event is retrieved and the user is asked to select either major or concurrent employment. A check is made to ensure that major employments do not overlap and valid data is entered into the schedule. When a major employment is scheduled, an annotation is made in a card field signifying that a major employment is scheduled for the appropriate days.

When the schedule is saved, this field is checked to ensure major employment for every day of the quarter. This field must also be saved with the schedule, and retrieved for use when modifying the schedule.

Information on the underway and inport dates is stored in the “official” schedule, since this information is required by other functional areas. The term “official” is used because the user may want to store several alternative schedules for the same time period during the schedule planning process. Only the information designated official will be available for use by other modules.

V. CONCLUSIONS

The design and implementation of the ARGOS operations module has demonstrated not only the feasibility of such a system, but also the strengths of HyperCard/HyperTalk as a system prototyping tool. The four subareas modeled are representative of basic areas of responsibility of the fleet operations officer. These areas are by no means all inclusive or complete.

Throughout the design process, an effort was made to keep the system as user-friendly and simple to operate as possible. The ARGOS operations module makes information available where and when it is needed. Thus, the user will be more productive, efficient, and make fewer errors. He can spend more time producing (i.e., writing a training schedule or operational report) and less time investigating. Formatted messages can be drafted quickly and virtually error free. Employment schedules and training schedules can be created and maintained quickly, and information can be extracted easily. The end result of the development of the ARGOS operations subarea is that the job efficiency of the people using the system will increase substantially.

Before the operations functional area can be fully implemented, there are several problem areas that must be addressed. First and foremost is security. The majority of publications, messages, and information the operations officer deals with on a daily basis carry at least a confidential classification. This fact limited the scope of development of the operations functional area, since it was desired to keep the ARGOS prototype unclassified. The solution to the security issue will undoubtedly involve a combination of the use of HyperCard's password capabilities and additional physical security measures.

Another need for full implementation is the requirement to integrate some type of ROEM (removable optical erasable media) and/or CD-ROM (compact disk - read only

memory) mass storage device. This capability is especially needed as a storage device for publications and instructions. Having reference publications on some computer accessible medium would allow rapid searching for subject matter by keywords. This capability, like all others in the ARGOS system, would greatly increase efficiency.

There are several areas of development in the operations functional area that are worthy of consideration for future research and development:

- Addressing the problems of computer security associated with the ARGOS system.
- Complete implementation of the message generation subarea, including computer interfaces with the ship's communication system.
- Development of the training sub-area as its own functional area, or the development of a transportable training module for use as an add-on to the administrative functional area.
- Development of a mass storage (ROEM/CD-ROM) capability for ARGOS.
- Design and Implementation of a navigation subarea or functional area.

Obviously, the above list is not a complete representation of the possible areas of improvement and expansion of the ARGOS system. A major portion of the acceptance of a new system such as ARGOS involves salesmanship. Demonstration of other applications of Macintosh and HyperCard/HyperTalk capabilities would only serve to increase the attractiveness of ARGOS as a system. For example, developing a personnel training module, while not directly associated with ARGOS, would make ARGOS more attractive, since the personnel training would use the same hardware. Alternatively, making ARGOS transportable to the MS-DOS environment would make the system very attractive, since that capability already exists in the fleet.

The primary goal in the development of the ARGOS system is to substantially reduce or eliminate the need for paper aboard ship. It is clear that this goal is met in the operations functional area. Additionally, significant increase in efficiency will be realized when using a fully implemented ARGOS system, since data is more accessible to the user than it is when stored on paper.
